

SSM/I vs TMI Intercomparisons

Tom Wilheit

Texas A&M University

Input data provided by CSU -
Result of their FCDR effort

Two years used 2002 and July 2005 through June 2006 (X-CAL year)

3 Satellites F13, F14, F15

Matchups courtesy of UCF--Thanks

Two algorithms used:

Analysis (GDAS) Based

Fitting (7 or 9 TMI channels as input)

Results averaged over whole data set and Lowest Quartile of TMI 21V

Calibration Reference TMI Version 7

Filters Applied

3σ filter (corresponding channels within 3σ of average difference)

GDAS surface temperature/pressure not crazy

TMI samples > 79

SSM/I samples > 59

Salinity > 30 ppt (i.e. GDAS thinks it's ocean)

TMI 10H < 120K (TMI thinks it's ocean)

(no corresponding filter for SSM/I)

Sigma < 2K for V pol channels, 3K H pol channels

Skip forward 3 minutes in TMI time after each matchup used.

No more than 400 samples/month

SSM/I BIAS wrt TMI (K)

Conclusions

Offsets were expected since FCDR used different Reference

Different methods gave almost identical results

Should have been the same for all 3 sensors—they weren't quite

Secular drift?

Even with an effort like CSU FCDR, there is still a job for X-CAL to do
